

# Node – RED Services

Node-RED allows you to create functionality by wiring together flows of data between nodes using a browser. And it has gained tremendous popularity in the IoT space, by modeling bits of application functionality between IoT devices like sensors, cameras, and wireless routers

Announcements

Support for the Geospatial feature will end on January 31, 2023

At that point:

- Users will be unable to query /\$DATABASE/\_design/\$DDOCS/\_geo endpoints. Requests to those endpoints will return a 404 Not Found response.
- Users will be able to define st\_indexes in design documents but they will be ignored by the service. This ensures that existing design documents can be updated and replications containing geospatial indexes will not fail.
- Existing geo indexes will be deleted, and customers will no longer be billed for the space they consume.
- IBM Cloud support will not longer answer questions or assist with issues related to the Geospatial feature of the Cloudant service.

In many cases existing applications will fail if changes are not made to address the removal of this functionality prior to the end of support on January 31, 2023. Please refer to the Cloudant blog for information on creating simple geospatial queries without using the Geospatial feature that is being removed from the Cloudant service.

The \_show, \_list, \_update and \_rewrite functions are deprecated

The following Cloudant features are deprecated:

- show functions: used to modify the format of the response when requesting a single document from the database.
- list functions: similar to show functions, but applied to the output of MapReduce views.
- rewrite functions: used to embody routing logic in CouchApps.
- update functions: used to carry out business logic within the database e.g. adding a timestamp to all document writes.
